

formed epidermis were followed on paraffin sections from biopsies taken on day 4 (1st patient), day 6 (2nd patient) and day 9 (3rd patient) after RHPS grafting. The skin sections of all three patients were immunostained with monoclonal antibodies against vimentin, keratin 10 and involucrin. FISH, using the CEP Y-satellite III

DNA probe, was used to visualize the Y chromosome in the paraffin sections of all patients. As a positive control we used normal male skin. The detailed morphology and results of immunohistochemical staining are shown in Fig. 1. The results of immunostaining with keratin 10 are not shown in the figure as they were very
