g I - HLA-A, -B, and -C allele frequencies in the Slovak population

g II - calculated HLA-A, -B and -Cw gene frequencies in the Slovak population

g III - HLA-A, -B, and -C allele frequencies in the Czech population

well as homozygous alleles, because no family studies have been realized.

The allele frequencies found in our study were compared to those in the Czech population (Drabek et al., 1998; Ivašková et al., 1998) (Table 2). No statistically significant differences were found.

The establishment of frequencies of HLA alleles is important for the general population genetics, and especially for studies of associations between the HLA system and diseases. The introduced DNA-typing methods are of importance for the selection of suitable donor-recipient pairs in organ and tissue transplantations.
